## Background

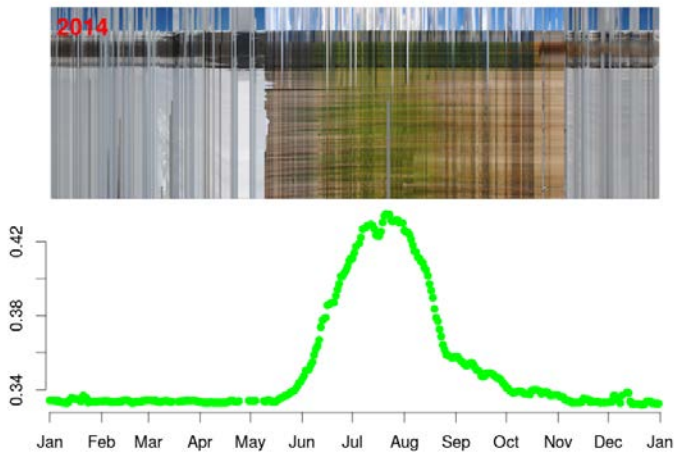

---

- ✓ Use of digital camera to track **canopy phenology**
- ✓ Phenology is a key regulator of ecosystem processes and biosphere feedbacks to climate
- ✓ First applications date back to 2007 (Richardson *et al.* Oecologia, 2007)

## Background

---

## what we have learned so far

---

- ✓ **Greenness Index** ( $GCC = G / (R + G + B)$ ): has proven to be an effective index over a wide range of ecosystems
- ✓ **setup**: camera model and installation instructions
- ✓ **processing**: tested filtering, fitting and phenophases estimation procedures
- ✓ **typical applications**: comparison with ground observations, evaluation of remote sensing phenology products, productivity, canopy properties, ...

## Processing

---

Typical processing workflow  
e.g. phenpix R package (Filippa *et al.* 2016)

- ✓ ROI definition
- ✓ RGB data extraction and VIs (e.g. GCC, GEI, RCC, ..) computation
- ✓ filtering
- ✓ curve fitting
- ✓ estimation of phenological phases dates

## Phenocam vs. field observations

phenocam vs. ground observations

✓ spring RMSE: 1-8 days

✓ autumn phases RMSE: 4-16 days

Larch forest in the Alps

Keenan *et al.* 2014

## Phenocam vs. field observations

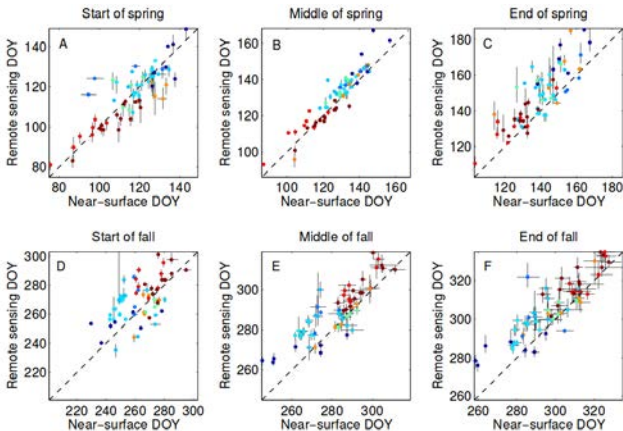

- ✓ phenocam vs. visual image inspection
- ✓ **good accuracy** for spring phases and **lower accuracy** for autumn phases

Wingate *et al.* 2015

## Evaluation of remote sensing phenology products

- ✓ phenocam dates vs. RS dates: MODIS and AVHRR
- ✓ EVI has smaller uncertainties than NDVI + higher accuracy for spring phases + differences decrease with fractional forest cover

Klosterman *et al.* 2014

## Evaluation of remote sensing phenology products

- ✓ phenocam dates vs. Landsat phenology algorithm (LPA)
- ✓ better agreement for **spring phases** than for **autumn phases**

**Fig. 4.** Relationships between Landsat- and PhenoCam-derived SOS (a) and EOS (b and c) dates across PhenoCam sites. Dashed lines are 1:1 and solid lines are reduced major axis (RMA) regression models where between-site correlations are statistically significant ( $p < 0.01$ ). RMA slope ( $\beta_1$ ) and intercept ( $\beta_0$ ) coefficients are provided with 95% confidence intervals. Horizontal bars indicate one standard deviation in SOS or EOS during each site year across a 500 m radius centered on each camera location.

Melaas *et al.* 2016

## Seasonality of canopy photosynthesis

- ✓ canopy greenness is often in close agreement with photosynthesis (e.g. Toomey *et al.* 2015)
- ✓ several examples of productivity modelling: Hufkens *et al.* 2016, Migliavacca *et al.* 2011, Knocks *et al.* 2017, ...

FIG. 2. Time series of daily GPP (black circles,  $\text{g C m}^{-2} \text{d}^{-1}$ ) and GCC (green chromatic coordinate, gray diamonds) for (a) deciduous broadleaf forest (DBF); (b) evergreen needleleaf forest (ENF); and (c) grassland/crops (GRS). Two characteristic years of data are featured in each subplot. See *Methods* for acronyms.

## Canopy properties

Yang *et al.* 2014

- ✓ few studies evaluated the relation between GCC and canopy physiological, biochemical, structural properties (e.g. Yang *et al.* 2014, Keenan *et al.* 2014, Wingate *et al.* 2015, Luo *et al.* 2018 submitted)

- ✓ combined effect of leaves color and canopy structure (i.e. LAI) and the colour of the background
- ✓ GCC insensitive to LAI changes above 2-2.5  
→ temporal mismatch or nonlinear relationship
- ✓ ... further studies needed

## Phenocam networks and dataset availability

---

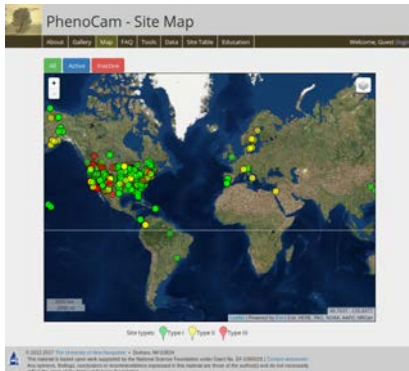

Great opportunities thanks to the increasing number of observation sites, networks and datasets  
(Brown *et al.* 2016)

- ✓ **Phenocam USA**
- ✓ **ICOS ecosystem stations**
- ✓ **other EU networks**
- ✓ **Australian phenocam network**
- ✓ **Phenological Eyes Network (PEN)**

## Phenocam USA

---

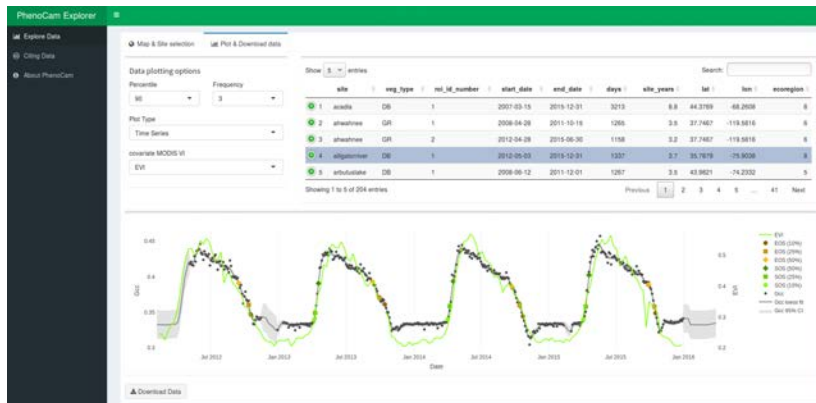

[phenocam.sr.unh.edu](http://phenocam.sr.unh.edu)

- ✓ > 450 sites
- ✓ data set: **PhenoCam Dataset v 1.0** under release: [explore.phenocam.us](http://explore.phenocam.us)
- ✓ > 750 site-years from different vegetation zones (392 DBF, 121 GRA, 80 ENF)
- ✓ quality-controlled
- ✓ seasonal greenness trajectories and phenophases dates
- ✓ Richardson *et al.*, Tracking vegetation phenology across diverse North American biomes using PhenoCam imagery. Scientific Data, in press

## Phenocam USA

[explore.phenocam.us](http://explore.phenocam.us)

contact Andrew Richardson or Koen Hufkens for details

## ICOS ecosystem stations

---

[www.icos-etc.eu/icos](http://www.icos-etc.eu/icos)

- ✓ network under deployment
- ✓ station labelling phase
- ✓ phenocam protocol and instructions nearly ready
- ✓ camera model: NetCam SC 5MP IR, StarDot Technologies
- ✓ centralized processing and data distribution @ETC

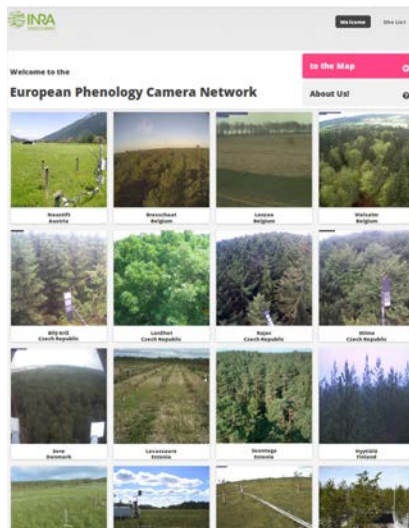

## European Phenology camera network

> 70 sites

european-webcam-network.net

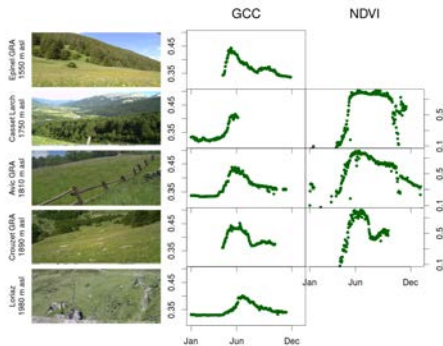

Wingate *et al.* 2015

## Other EU networks

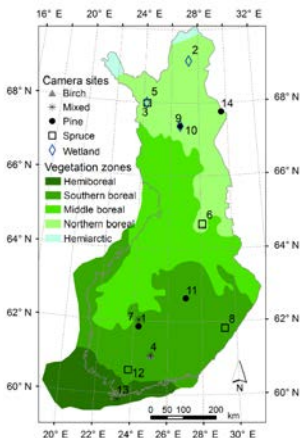

- ✓ Alpine network (IT-FR)
- ✓ 15-20 active sites
- ✓ coupled phenocam and field NDVI sensors

## Other EU networks

✓ Finland network: 31 sites

✓ Peltoniemi et al. 2018

✓ SITES spectral network: Swedish Infrastructure for Ecosystem Science

✓ [www.fieldsites.se](http://www.fieldsites.se)

**SITES Spectral** is an infrastructure for collecting spectral data for ecosystem monitoring. Through this infrastructure, SITES can provide data for research-related to climate change, carbon and greenhouse gas balance, phenology, general ecology and biodiversity and related science.

SITES Spectral is an infrastructure for collecting spectral data for ecosystem measurements. By field and satellite measurements, vegetation properties and other related variables in vegetation conditions are captured over small and intermediate areas. The SITES Spectral network consists of multi-spectral sensors, phenology cameras and other sensors.

The available data is relevant to the studies of a number of processes in the ecosystems, for example, productivity, efficiency of use of light and nutrient conditions. Through this infrastructure SITES can provide data for research-related to e.g. climate change, carbon and greenhouse gas balance, phenology, general ecology and biodiversity and plant ecology.

**How does SITES Spectral work?**  
Field and satellite (satellite) sensors record incoming and reflected solar radiation in visible and near infrared wavelengths channels. The spectral signals from vegetation carry dynamic information on a range of vegetation properties, e.g. phenological state, biomass, leaf area development, leaf chemical constituents (nitrogen, water, chlorophyll etc.), and photosynthetic light use absorption. By spectral measurement of vegetation growth and development, vegetation properties and processes can be monitored. SITES Spectral also facilitates the ability to measure how efficiently light is converted to carbon including other biophysical processes. The SITES Spectral equipment also includes phenological cameras and the possibility to measure large areas (data from commercial satellite sensors (SITES)).

**Participating field research stations**  
Abisko  
Åre  
Eken  
Långsele  
Åre  
Wagfors  
Hörsnäs  
Svea

**Measurement program**  
SITES Spectral

**Coordinator**  
Jani Hänninen  
jani.hanninen@fieldsites.se

**Live data from Åre**

**SITES Northern and SITES Spectral**  
In the winter 2015-2016, it was expanded to include SITES Spectral. Same content, different name!

## Australian phenocam network and TERN SuperSites

Brown *et al.* 2016, Moore *et al.* 2016

**GWWL**

Name:	GWWL
Location:	Great Western Woodlands
Species:	Varied
Start:	2015-09-11 03:17:00
End:	2015-09-11 03:17:00
Timestreams:	Show/Hide

**SEOP Samford**

Name:	SEOP Samford
Location:	Samford Ecological Research Facility
Species:	Various
Start:	2015-09-21 03:14:00
End:	2015-09-21 03:14:00
Timestreams:	Show/Hide

[phenocam.org.au](http://phenocam.org.au)

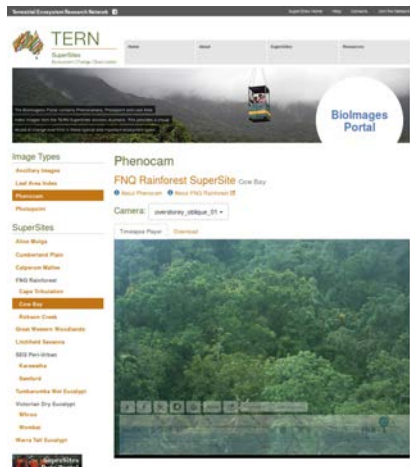

- ✓ intensive field station in typical Australian biomes
- ✓ field and sensor monitoring
- ✓ plant physiological measurements, OzFlux system

## Australian phenocam network and TERN SuperSites

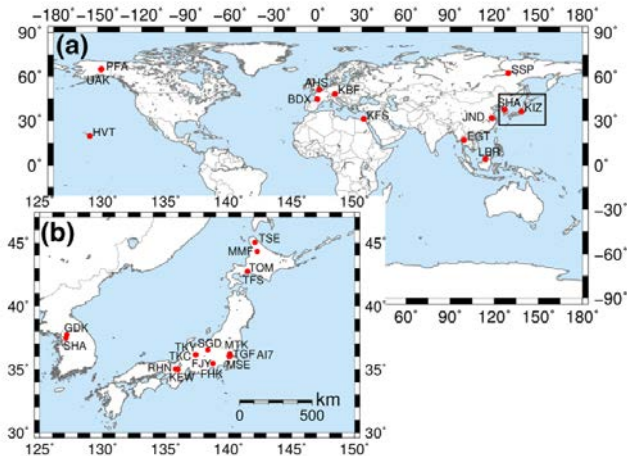

Phenocam images from the Calperum Mallee SuperSite just prior to and just after the fire, Jan 2014

- ✓ Phenocams deployed on OzFlux towers and sub-canopy
- ✓ Sentinel Camera: Raspberry PI based with USB camera, site conditions and low power use
- ✓ Image repository: bioimages portal [bioimages.tern.org.au](http://bioimages.tern.org.au)
  - ✓ LAI, photogrammetry with drones, ...
  - ✓ more info @ Tim Brown and Michael Liddell

## Phenological Eyes Network (PEN)

Nasahara *et al.* 2015
[www.pheno-eye.org](http://www.pheno-eye.org)

## New applications and perspectives

---

- ✓ use of NIR-enabled cameras to compute camera NDVI (CamNDVI)
- ✓ GPP phenology with GCC, CamNDVI or new phenocam-base indices (e.g.  $\text{NIR}_v$ )
  - ✓ spatial analysis
  - ✓ impact of climate extremes
  - ✓ UAV

## Camera NDVI

- ✓ near-infrared enabled cameras (e.g. StarDot NetCam SC 5MP IR camera)

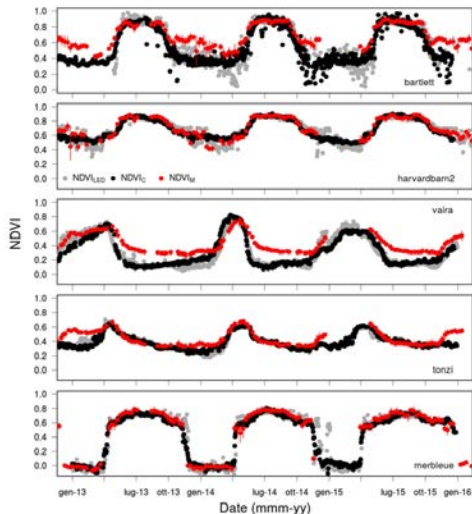

- ✓ sequential capture of **visible-only (RGB)** and combined **visible+NIR** images
- ✓ calculate camera-based NDVI (CamNDVI) (Petach *et al.* 2014)

Petach *et al.*, 2014

## Camera NDVI

NDVI derived from near-infrared-enabled digital cameras: Applicability across different plant functional types, Filippa *et al.* 2017

- compare CamNDVI to MODIS NDVI and ground NDVI measures

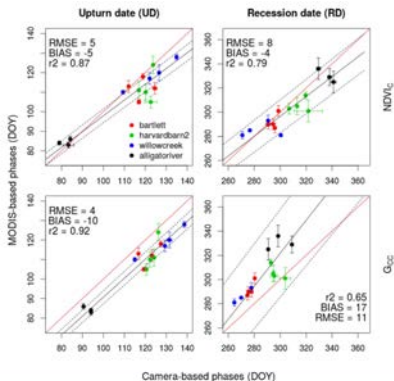

- ✓ CamNDVI is an accurate estimate of NDVI

## Camera NDVI

Filippa *et al.* 2017

- camera-derived phenological transition dates vs. MODIS Land Cover Dynamics Product (MCD12Q2)

- ✓ higher accuracy CamNDVI-MCD12Q2 in autumn phases

## Camera NDVI

Filippa *et al.* 2017

- compare CamNDVI and GCC seasonal trajectories

- ✓ GCC is more sensitive to changes in leaf color and CamNDVI is more sensitive to changes in leaf area/canopy structure
- ✓ CamNDVI and GCC provide complementary informations in particular in ENF sites (*P. strobus*)

GPP phenology with  $\text{NIR}_v$ 

## SCIENCE ADVANCES | RESEARCH ARTICLE

## ENVIRONMENTAL SCIENCE

## Canopy near-infrared reflectance and terrestrial photosynthesis

Grayson Badgley,<sup>1,2\*</sup> Christopher B. Field,<sup>1,2</sup> Joseph A. Berry<sup>1</sup>

Global estimates of terrestrial gross primary production (GPP) remain highly uncertain, despite decades of satellite measurements and intensive in situ monitoring. We report a new approach for quantifying the near-infrared reflectance of terrestrial vegetation ( $\text{NIR}_v$ ).  $\text{NIR}_v$  provides a foundation for a new approach to estimate GPP that consistently untangles the confounding effects of background brightness, leaf area, and the distribution of photosynthetic capacity with depth in canopies using existing moderate spatial and spectral resolution satellite sensors.  $\text{NIR}_v$  is strongly correlated with solar-induced chlorophyll fluorescence, a direct index of photons intercepted by chlorophyll, and with site-level and globally gridded estimates of GPP.  $\text{NIR}_v$  makes it possible to use existing and future reflectance data as a starting point for accurately estimating GPP.

$$\checkmark \quad \text{NIR}_v = \text{NDVI} \times \text{NIR reflectance}$$

✓ Monthly MODIS  $\text{NIR}_v$  has a higher correlation with globally gridded GPP than GOME-2 SIF and MODIS NDVI (Fig.2 and Fig.3)

✓  $\text{NIR}_v$  describes the relationship between canopy light capture and GPP

## GPP phenology with NIR<sub>v</sub>

GPP phenology using phenocam NIR<sub>v</sub>: first results from Mediterranean tree-grass ecosystems (ES-Lm1, ES-Lm2, ES-Alb), Luo *et al.* in prep

- ✓ NIR<sub>v</sub> increases accuracy in the estimation of GPP phenology compared to GCC and CamNDVI
- ✓ expanding the analysis in Ameriflux sites using phenocam dataset
- ✓ more info @ Mirco Migliavacca and Yunpeng Luo

## Spatial analysis: potential to monitor biodiversity

✓ clustering based on phenological diversity

Filippa *et al.* 2015

✓ phenological mapping

Snyder *et al.* 2017

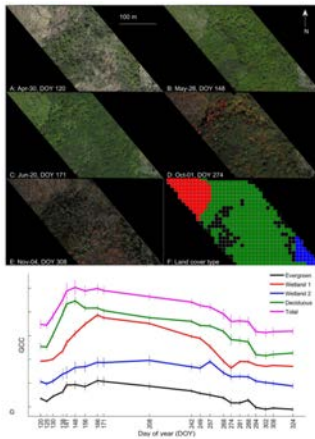

## Impact of climate extremes

- ✓ **GCC anomalies** can be used to detect climate extreme impacts on functional or structural canopy properties
- ✓ e.g. summer heat wave in a mountain grassland. Impacts on canopy photosynthesis parameters (i.e. **A<sub>max</sub>**) and structural canopy properties (**LAI** and **biomass**), Cremonese *et al.* 2017
- ✓ examples of **late frost** impact: Menzel *et al.* 2015, Hufkens *et al.* 2012

## UAV

✓ plant communities high resolution  
phenology maps (Klosterman *et al.* 2018)

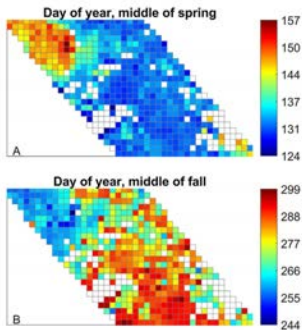

✓ understory invasive species detection based  
on GCC threshold (Leduc *et al.* 2018)

## UAV

✓ plant communities high resolution  
phenology maps (Klosterman *et al.* 2018)

✓ understory invasive species detection based  
on GCC threshold (Leduc *et al.* 2018)

## Conclusions

---

- ✓ GCC and CamNDVI provide complementary information to improve the understanding of phenological cycles, dynamics of ecosystem functions and their response to climate variability and extreme events
- ✓ potential to monitor biodiversity with phenocam spatial analysis and combined with drones, dynamics of photosynthesis and provide data for phenology models (e.g. Hufkens *et al.*, 2018, phenoR)
- ✓ direct link with structural and functional traits requires further attention
- ✓ great opportunities emerging from new sites deployment, network establishment, data archiving and data release (standard site set-up and processing allowing cross site comparison)
- ✓ EU initiatives could benefit from a trans-national coordination, beside ICOS sites. Opportunities for a new COST action?

---

# Thank you for the attention
