

Metadata for (spectral) UAV remote sensing of vegetation

Helge Aasen

Department of Geoscience, University of Cologne, Germany

helge.aasen@uni-koeln.de

Unmanned aerial vehicles (UAVs)

- flexible carrier platforms
- fly below clouds
- very high resolution data
- moving (shaking) platform
- limited payload
- small, lightweight, fast sensors req.

Spectral remote sensing

- vegetation monitoring
- non-invasive sampling
- plants are complex
- environmental conditions change

Figure 1.21 Multistage remote sensing concept.

Path of information

particle to pixel

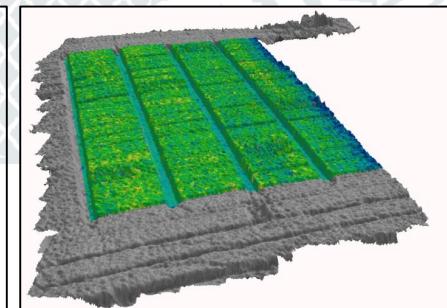

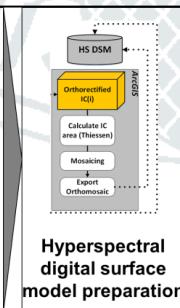

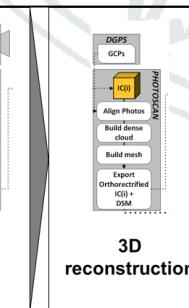

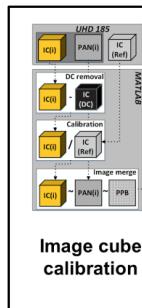

Environment

Sensor system

Data processing

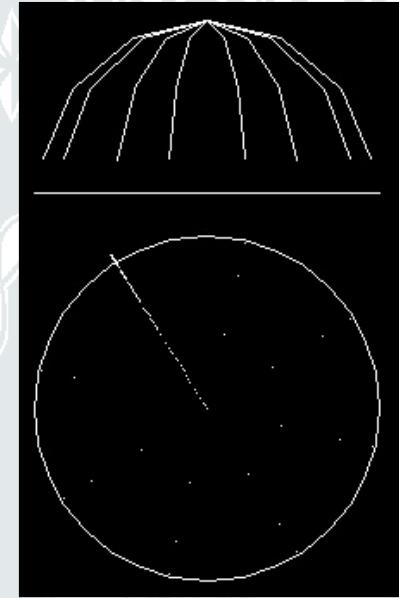

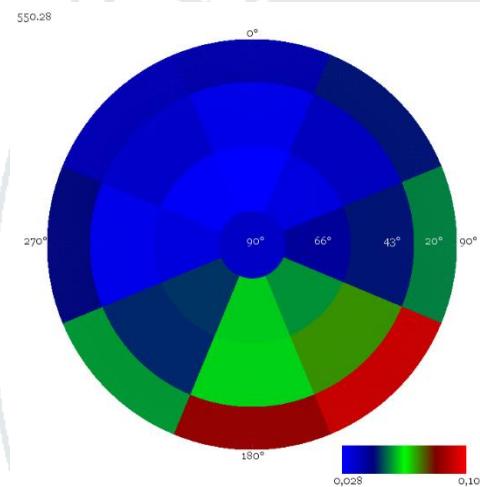

Data product

Data modification

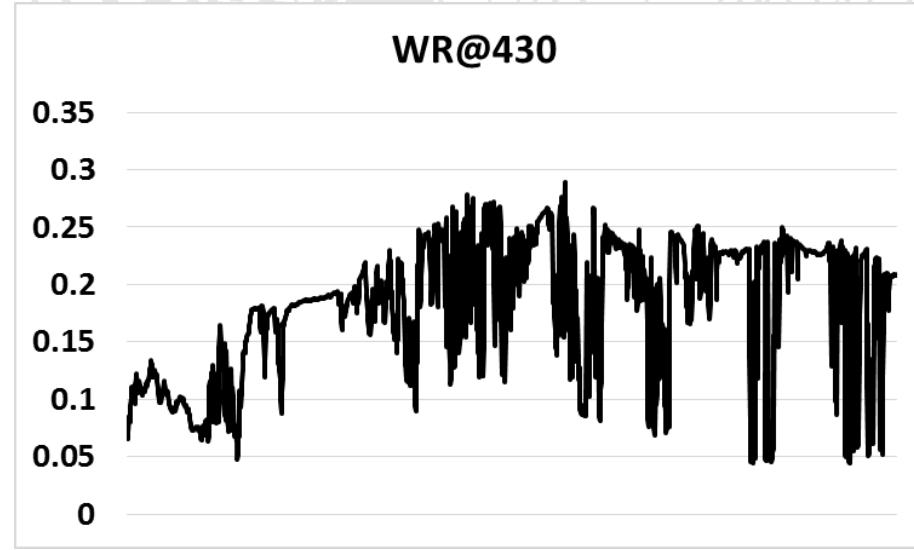

Environmental effects

BRDF

(Burkart et al. 2015)

Irradiance

(A. Burkart, unpublished)

helge.aasen@uni-koeln.de

Environmental effects

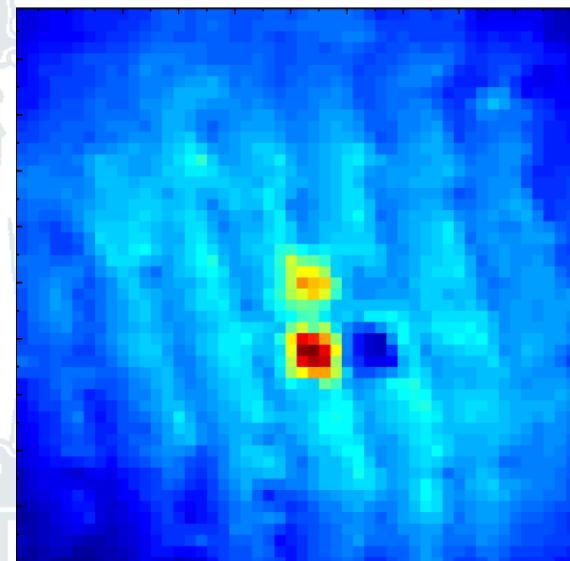

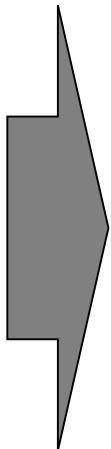

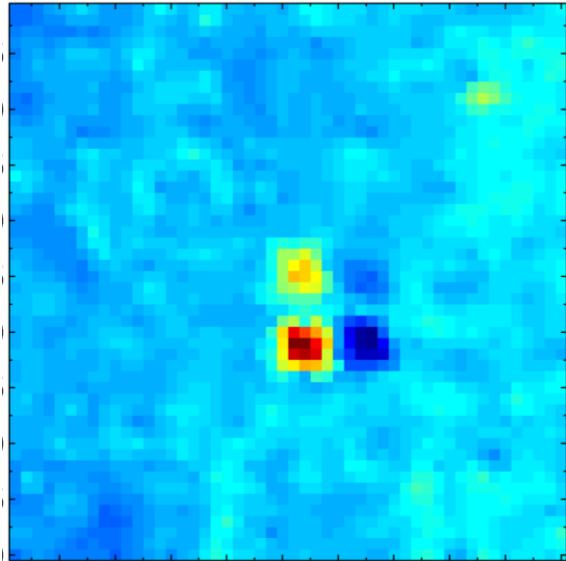

Wind

	Per measurement	Disclose in publication
Environmental metadata <ul style="list-style-type: none">• Sun position, UTC time (BRDF)• Irradiance intensity (physical unit transformation)• Wind direction and intensity (leaf inclination)• precipitation and dew point previous to the measurements (are the leafs wetted?)	X X X X	g g g g

Sensor metadata

“nature”

Sensor metadata (physical unit transformation)

- Radiometric response (including optical path effects) per pixel
- Dark current per pixel (function)
- FWHM, band center wavelength, dynamic range

6

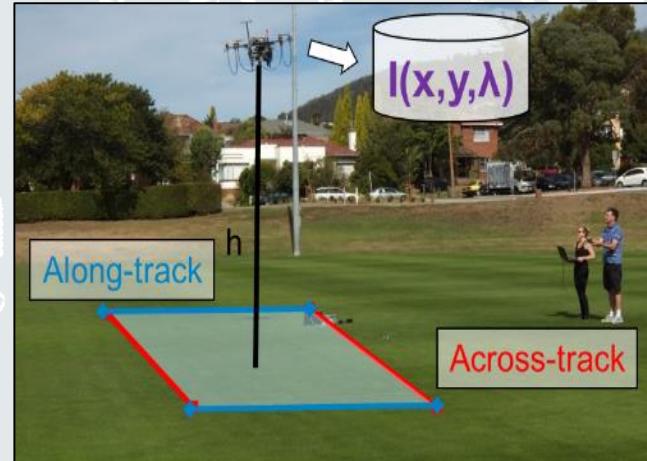

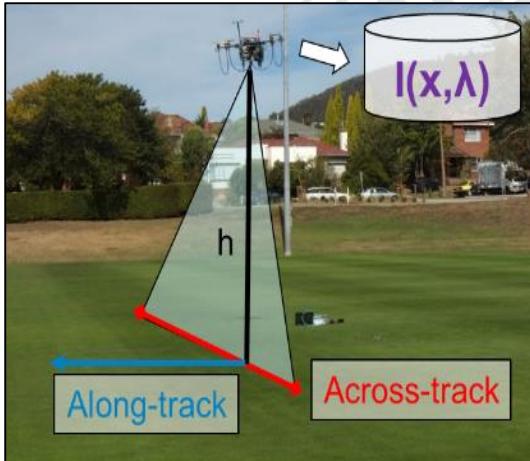

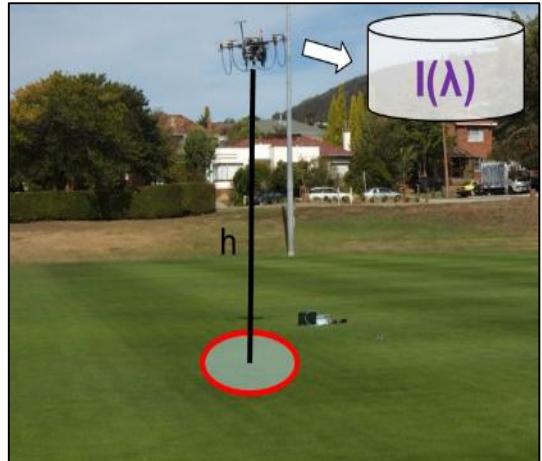

DN

helge.aasen@uni-koeln.de

Measurement metadata

Flying spectrometer

Line scanner

Image-frame camera

Data complexity

Orientation and positioning metadata requirements

Measurement metadata

- Sensor temperature (physical unit transformation)
- Integration time (physical unit transformation)
- Orientation and position (orthorectification, BRDF per pixel)

x

Processing metadata

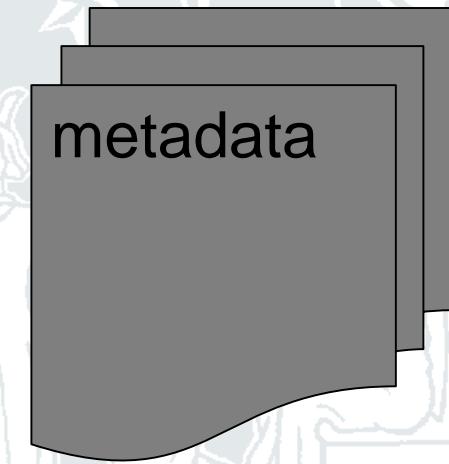

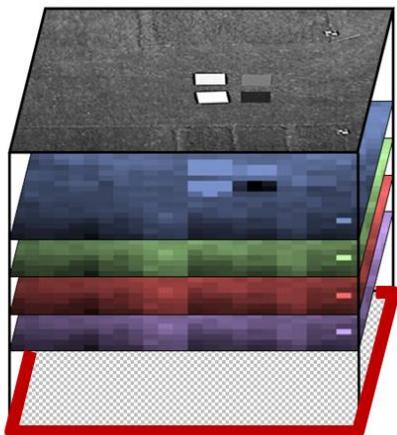

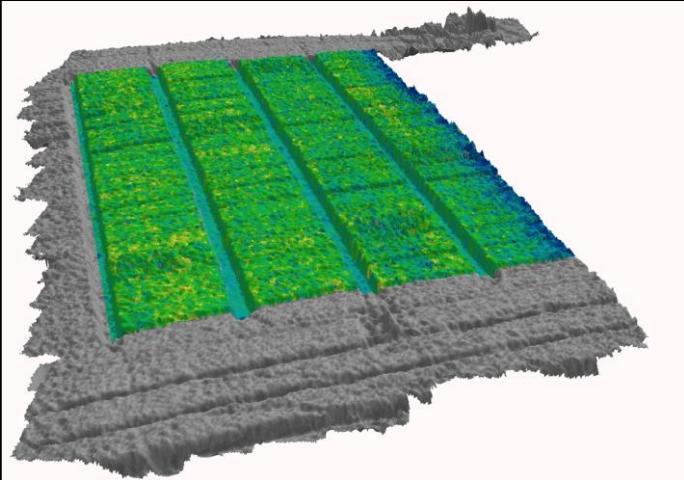

Data processing metadata

- Software & version
- Processing chain
- Processing parameters

x

Data product metadata

Data product metadata (to accompany the final data product)

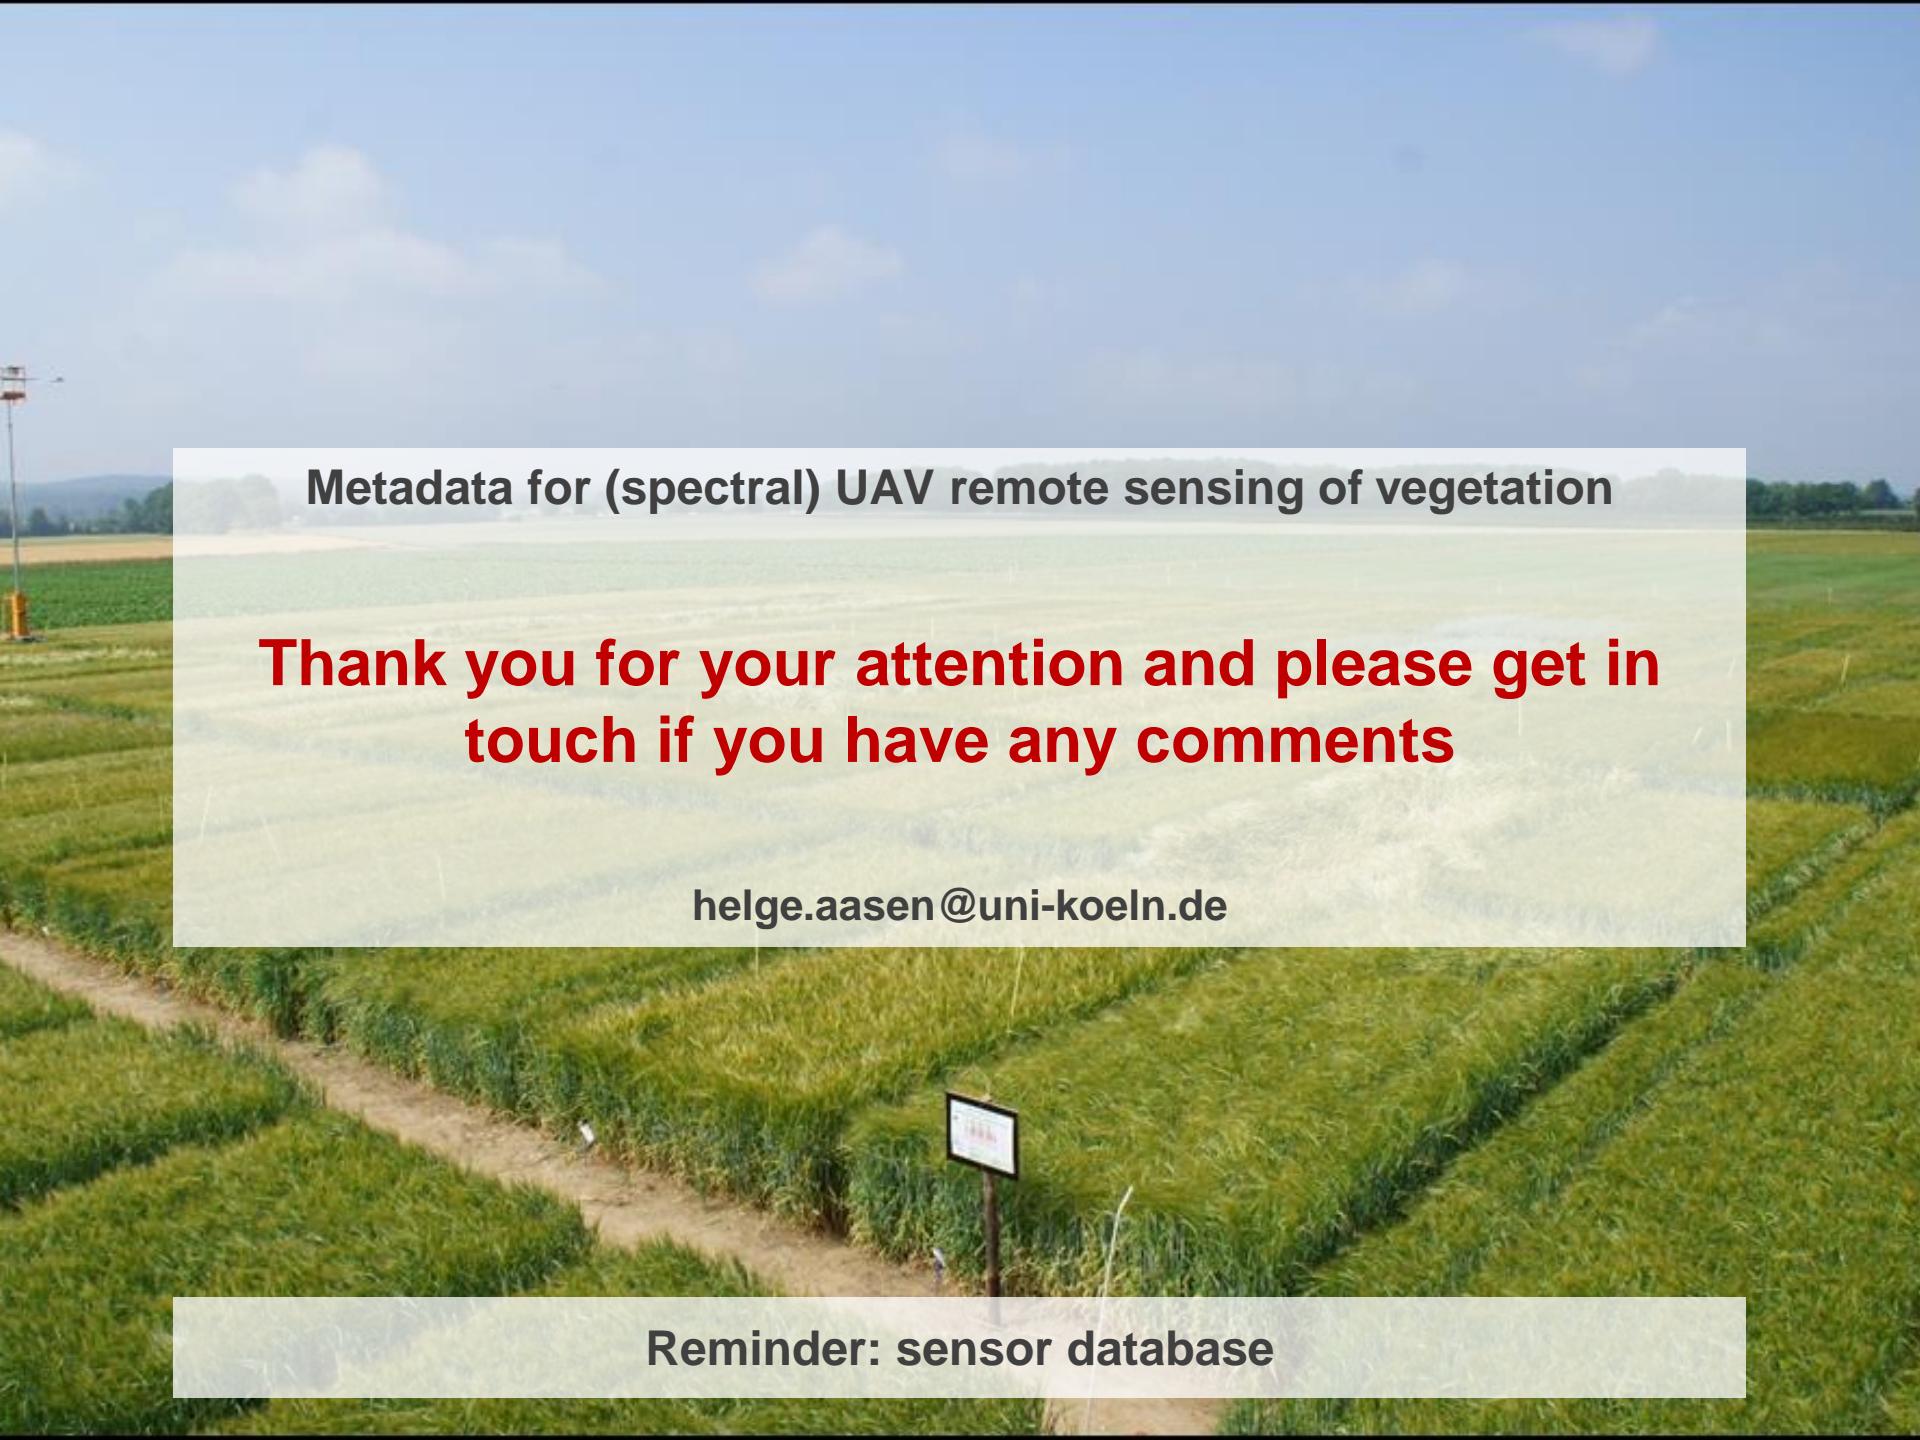

- General (summary of the data acquisition circumstances)
 - Spatial and spectral resolution, band configuration
 - Corrected parameters (were irradiance / BRDF changes corrected?)
 - Environmental metadata
- Pixel wise
 - Reference to sensor pixel wise parameters (to calculate SNR, radiometric precision etc. if needed)
 - Image cubes containing the pixel wise information from the sensor characterization

Conclusions

- High spatial and temporal resolution make environmental effects more visible
- We are responsible to ensure good data quality
- We are responsible for the data management

➤ Lets connect

The background of the slide shows a wide, green agricultural field with distinct rows of crops. A dirt path or track cuts through the field from the bottom left towards the center. In the middle ground, there is a small signpost standing in the grass. The sky above is blue with some scattered white clouds.
